A. The value of R_{0JA} is measured with the device in a still air environment with T_A=25°C.

B. The power dissipation P_D is based on T_{J(MAX)}=175°C, using junction-to-case thermal resistance, and is more useful in setting the upper dissipation limit for cases where additional heatsinking is used.

C. Repetitive rating, pulse width limited by junction temperature T_{J(MAX)}=175°C, Ratings are based on low frequency and duty cycles to keep initial T_J=25°C.

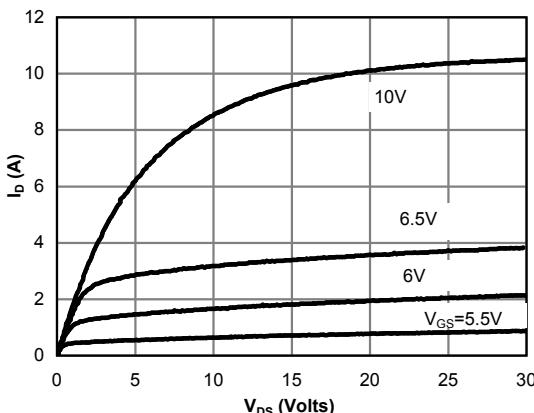

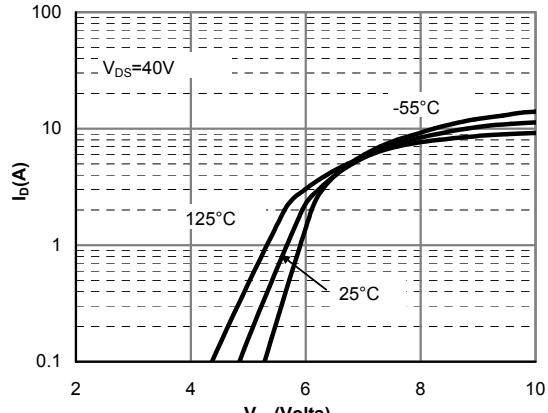

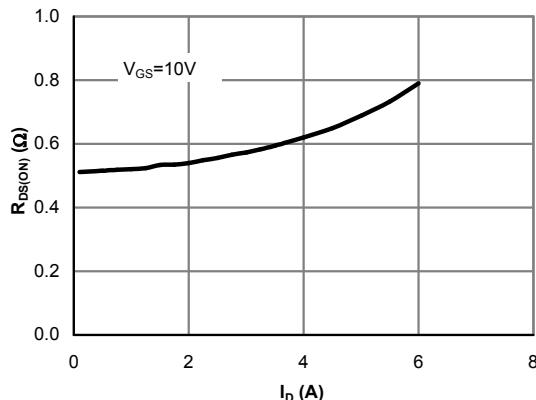

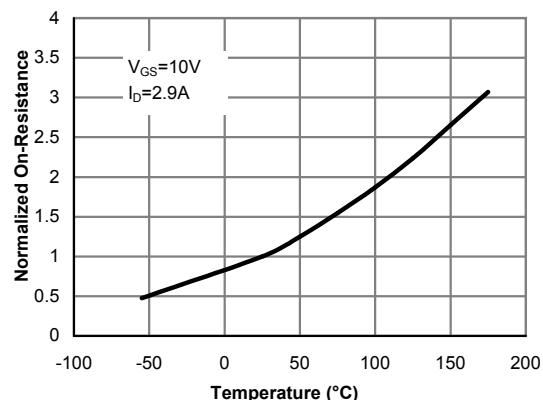

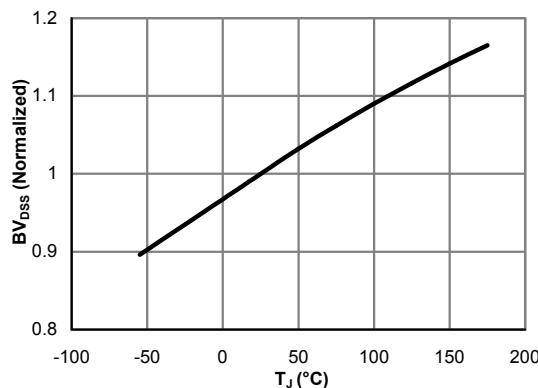

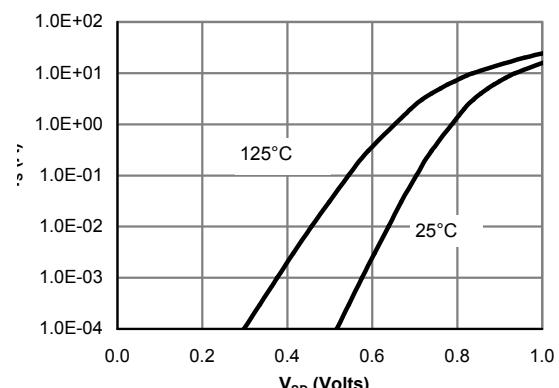

D. The R_{0JA} is the sum of the thermal impedance from junction to case R_{0JC} and case to ambient.

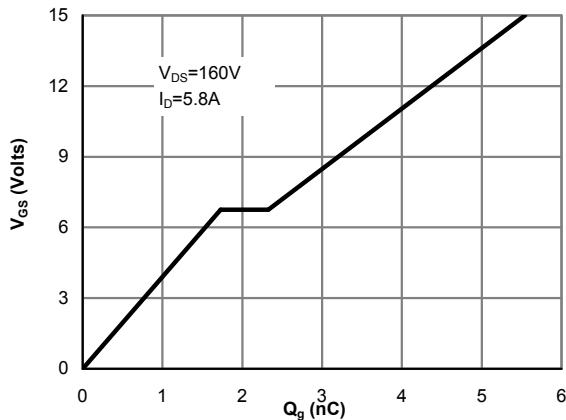

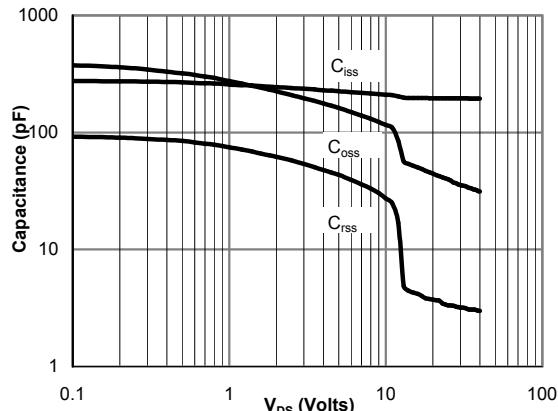

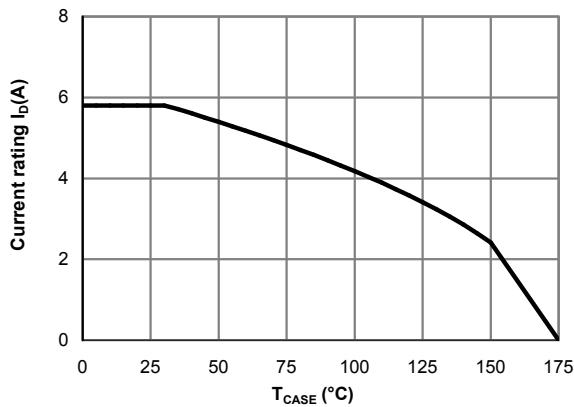

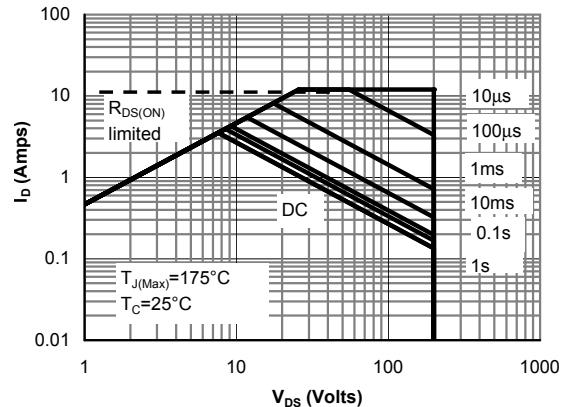

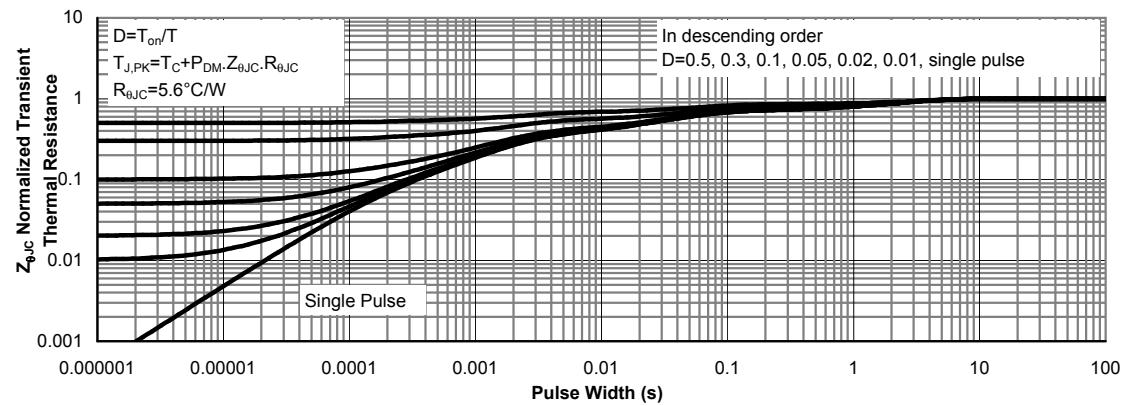

E. The static characteristics in Figures 1 to 6 are obtained using <300 μs pulses, duty cycle 0.5% max.

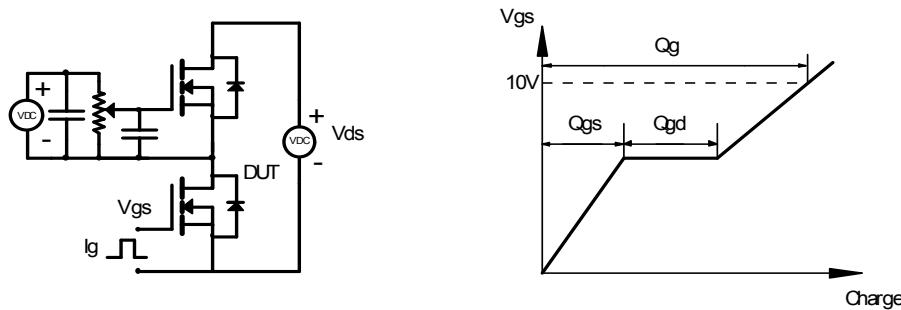

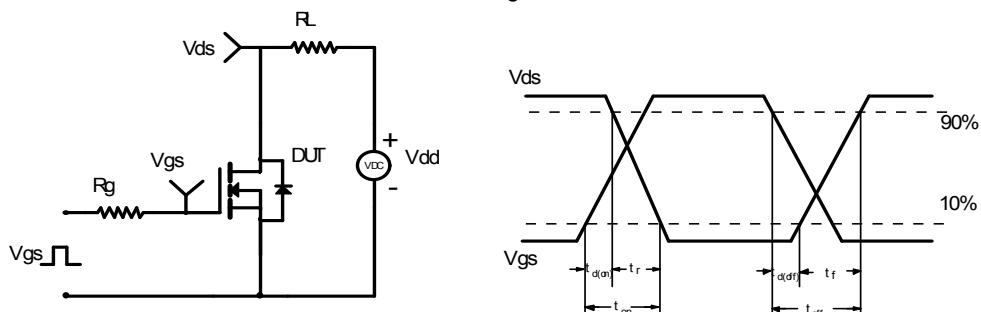

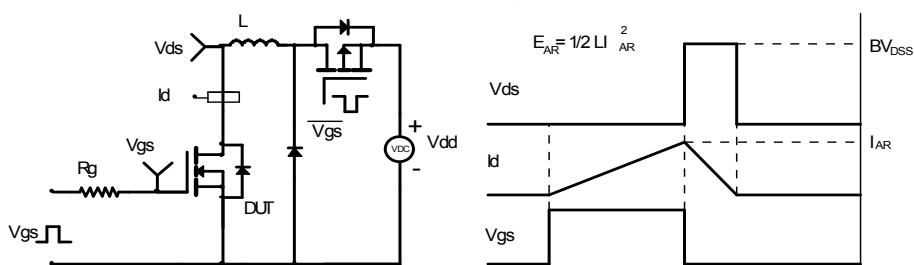

F. These curves are based on the junction-to-case thermal impedance which is measured with the device mounted to a large heatsink, assuming a maximum junction temperature of T_{J(MAX)}=175°C. The SOA curve provides a single pulse rating.

G. L=60mH, I_{AS}=1.9A, V_{DD}=150V, R_G=25Ω, Starting T_J=25°C
